Background

• Discoid Domain Receptor 1 (DDR1) is a collagen-binding receptor tyrosine kinase expressed by tumor cells. It has been implicated in cancer invasion, progression, and immune exclusion.

• A first-in-human trial of PRTH-101, an α-DDR1 monoclonal Ab, is underway.

• The relationship between DDR1 mRNA, DDR1 protein, and the epithelial composition of the tumor microenvironment across tumor types has not been established and has the potential to influence indication and patient selection for DDR1-targeted therapies.

Methods

• Human tumor samples (n= 93) from a range of epithelial and mesenchymal tumor types were evaluated by bulk RNA-sequencing and multiplex immunofluorescence microscopy (mIF) of DDR1 and pan-keratin (CK) using the Ultivue platform (Figure 1).

• DDR1+ cell density was determined for each sample by image analysis.

• For epithelial tumors, tumor-stromal segmentation was performed by image analysis with tumor epithelium defined by CK positivity in the pathologist-annotated tumor bed. Percentage of epithelium was calculated per sample.

• Correlative analyses were done to relate DDR1 mRNA expression to DDR1+ cell density (all tumor types), proportion of tumor cells expressing DDR1 (epithelial tumors only), and percentage of tumor epithelium (epithelial tumors only).

Disclosures

• Drs. Dillon, Sher, Schürpf, and Clifton and Mr. Gootkind are employees of Incendia Therapeutics.

• Dr. Berlin is on the advisory boards of Mirati, Insmed, Oxford Biotherapeutics, Biosapien, EMD Serono, Ipsen, Merck Sharpe & Dohme, Merus, BMS, and Bexion and DSMBs for AstraZeneca, Novocure, Bi, and I-SPY. He receives research support from Abbvie, Astellas, Atreca, Bayer, Dragonfly, I-Mab, Lilly, Incyte, EMD Serono, Pfizer, BMS, Transcenta Tx, Tyra, Tats, Sumitomo Dainippon Pharma Oncology, 23 and me, Incendia Tx, and Hibercell.

Results

• DDR1+ cell density was significantly higher in tumors of epithelial origin than in tumors of mesenchymal origin (median 2803 vs 9 cells/mm²) (Figure 2, Table 1).

• Moderate correlation was observed between DDR1 mRNA expression and DDR1+ cell density across all tumor types (R=0.48 p<0.0001) (Figure 3, Table 1).

• Within the epithelial tumors, a high proportion of tumor cells expressed DDR1 (median of 0.76) (Figure 4, Table 1).

Conclusions

• DDR1 is expressed in a high proportion of tumor cells across a range of epithelial tumor types, suggesting potentially broad application of DDR1-targeted therapies.

• As expected, since DDR1 is primarily expressed by tumor cells, both mRNA and protein expression levels are correlated with the proportion of tumor epithelium.

• Correlation between DDR1 mRNA and protein appears to be tumor type specific, possibly due to differences in DDR1 protein density in DDR1+ cells and/or contamination of bulk RNA with adjacent tissue.

• Assessment of DDR1+ cell density may be more accurate for patient selection in certain tumor types.
